11. Martinez Darian

Group 1:

- Uses cases
  - A use case is missing for the customer to buy a ticket.
- Class Diagram
  - There are inconsistencies in the class diagram

Group 2:

- Class Diagram
  - Patient with appointment relationship doesn't make sense for composition

Group 3:

- Use case
  - Customer has no relationship.
- Class Diagram
  - Change product for shoes.
  - User class name is plural (misuse).
  - Create a "role" attribute in the User class.
- Code
  - Implement inheritance.

Group 4:

- Use cases
  - It should be a use case, add drink to stock and add drink to combo.
  - Limit the use case diagram.
- Class diagram
  - They give the classes in the view package the stereotype <<Interface>> (misused).
  - User classes (empty)
  - Password classes ( empty)
  - The association has been misused called "depends".
  - In the User class you have a password class composition (it's wrong).
  - The Password class breaks cohesion at the package level.
  - The Password class breaks consistency.
  - Move the unit tests to the Unit Test folder and don't leave it in code.
- Code
  - The keys in the Json file must be encrypted. (Vulnerability in system security).
  - Generate the invoice ID in the system.
  -
